1   Parametric survival models

Configuring R

Functions from these packages will be used throughout this document:

```r
library(conflicted) # check for conflicting function definitions
# library(printr) # inserts help-file output into markdown output
library(rmarkdown) # Convert R Markdown documents into a variety of formats.
library(pander) # format tables for markdown
library(ggplot2) # graphics
library(ggfortify) # help with graphics
library(dplyr) # manipulate data
library(tibble) # `tibble`s extend `data.frame`s
library(magrittr) # `%>%` and other additional piping tools
library(haven) # import Stata files
library(knitr) # format R output for markdown
library(tidyr) # Tools to help to create tidy data
library(plotly) # interactive graphics
library(dobson) # datasets from Dobson and Barnett 2018
library(parameters) # format model output tables for markdown
library(haven) # import Stata files
library(latex2exp) # use LaTeX in R code (for figures and tables)
library(fs) # filesystem path manipulations
library(survival) # survival analysis
library(survminer) # survival analysis graphics
library(KMsurv) # datasets from Klein and Moeschberger
library(parameters) # format model output tables for
library(webshot2) # convert interactive content to static for pdf
library(forcats) # functions for categorical variables ("factors")
library(stringr) # functions for dealing with strings
library(lubridate) # functions for dealing with dates and times
```

Here are some R settings I use in this document:

```
rm(list = ls()) # delete any data that's already loaded into R

conflicts_prefer(dplyr::filter)
ggplot2::theme_set(
  ggplot2::theme_bw() +
      # ggplot2::labs(col = "") +
    ggplot2::theme(
      legend.position = "bottom",
      text = ggplot2::element_text(size = 12, family = "serif")))

knitr::opts_chunk$set(message = FALSE)
options('digits' = 6)

panderOptions("big.mark", ",")
pander::panderOptions("table.emphasize.rownames", FALSE)
pander::panderOptions("table.split.table", Inf)
conflicts_prefer(dplyr::filter) # use the `filter()` function from dplyr() by default
legend_text_size = 9
run_graphs = TRUE
```

1.1 Parametric Survival Models

1.1.1 Exponential Distribution

- The exponential distribution is the basic distribution for survival analysis.

$$f(t) = \lambda e^{-\lambda t}$$
$$\log f(t) = \log \lambda - \lambda t$$
$$F(t) = 1 - e^{-\lambda t}$$
$$S(t) = e^{-\lambda t}$$
$$\Lambda(t) = -\log S(t)$$
$$= \lambda t$$
$$\lambda(t) = \lambda$$
$$E(T) = \lambda^{-1}$$

1.1.2 Weibull Distribution

Using the Kalbfleisch and Prentice (2002) notation:

$$f(t) = \lambda p(\lambda t)^{p-1} e^{-(\lambda t)^p}$$
$$F(t) = 1 - e^{-(\lambda t)^p}$$
$$S(t) = e^{-(\lambda t)^p}$$
$$\lambda(t) = \lambda p(\lambda t)^{p-1}$$
$$\Lambda(t) = (\lambda t)^p$$
$$\log \Lambda(t) = p \log \lambda t$$
$$= p \log \lambda + p \log t$$
$$E(T) = \lambda^{-1} \cdot \Gamma\left(1 + \frac{1}{p}\right)$$

> **ℹ Note**
>
> Recall from calculus:
> - $\Gamma(t) \overset{\text{def}}{=} \int_{u=0}^{\infty} u^{t-1} e^{-u} du$
> - $\Gamma(t) = (t-1)!$ for integers $t \in \mathbb{Z}$
> - It is implemented by the `gamma()` function in R.
>
>

Here are some Weibull density functions, with $\lambda = 1$ and p varying:

```r
library(ggplot2)
lambda = 1
ggplot() +
  geom_function(
    aes(col = "0.25"),
    fun = \(x) dweibull(x, shape = 0.25, scale = 1/lambda)) +
  geom_function(
    aes(col = "0.5"),
    fun = \(x) dweibull(x, shape = 0.5, scale = 1/lambda)) +
  geom_function(
    aes(col = "1"),
    fun = \(x) dweibull(x, shape = 1, scale = 1/lambda)) +
  geom_function(
    aes(col = "1.5"),
    fun = \(x) dweibull(x, shape = 1.5, scale = 1/lambda)) +
  geom_function(
    aes(col = "2"),
    fun = \(x) dweibull(x, shape = 2, scale = 1/lambda)) +
  geom_function(
    aes(col = "5"),
    fun = \(x) dweibull(x, shape = 5, scale = 1/lambda)) +
  theme_bw() +
  xlim(0, 2.5) +
  ylab("f(t)") +
  theme(axis.title.y = element_text(angle=0)) +
  theme(legend.position="bottom") +
  guides(
```

```
      col =
        guide_legend(
          title = "p",
          label.theme =
            element_text(
              size = 12)))
```

Figure 1: Density functions for Weibull distribution

Properties of Weibull hazard functions

Theorem 1.1. *If T has a Weibull distribution, then:*

- *When $p = 1$, the Weibull distribution simplifies to the exponential distribution*
- *When $p > 1$, the hazard is increasing: $h'(t) > 0$*
- *When $p < 1$, the hazard is decreasing: $h'(t) < 0$*
- *$\log \Lambda(t)$ is a straight line relative to $\log t$: $\log \Lambda(t) = p \log \lambda + p \log t$*

Exercise 1.1. Prove Theorem 1.1.

The Weibull distribution provides more flexibility than the exponential. Figure 2 shows some Weibull hazard functions, with $\lambda = 1$ and p varying:

```
library(ggplot2)
library(eha)
lambda = 1

ggplot() +
  geom_function(
    aes(col = "0.25"),
    fun = \(x) hweibull(x, shape = 0.25, scale = 1/lambda)) +
  geom_function(
    aes(col = "0.5"),
    fun = \(x) hweibull(x, shape = 0.5, scale = 1/lambda)) +
```

4

```
  geom_function(
    aes(col = "1"),
    fun = \(x) hweibull(x, shape = 1, scale = 1/lambda)) +
  geom_function(
    aes(col = "1.5"),
    fun = \(x) hweibull(x, shape = 1.5, scale = 1/lambda)) +
  geom_function(
    aes(col = "2"),
    fun = \(x) hweibull(x, shape = 2, scale = 1/lambda)) +
  theme_bw() +
  xlim(0, 2.5) +
  ylab(expr(lambda)) +
  theme(axis.title.y = element_text(angle=0)) +
  theme(legend.position="bottom") +
  guides(
    col =
      guide_legend(
        title = "p",
        label.theme =
          element_text(
            size = 12)))
```

Figure 2: Hazard functions for Weibull distribution

```
library(ggplot2)
lambda = 1

ggplot() +
  geom_function(
    aes(col = "0.25"),
    fun = \(x) pweibull(lower = FALSE, x, shape = 0.25, scale = 1/lambda)) +
  geom_function(
    aes(col = "0.5"),
    fun = \(x) pweibull(lower = FALSE, x, shape = 0.5, scale = 1/lambda)) +
```

5

```
geom_function(
  aes(col = "1"),
  fun = \(x) pweibull(lower = FALSE, x, shape = 1, scale = 1/lambda)) +
geom_function(
  aes(col = "1.5"),
  fun = \(x) pweibull(lower = FALSE, x, shape = 1.5, scale = 1/lambda)) +
geom_function(
  aes(col = "2"),
  fun = \(x) pweibull(lower = FALSE, x, shape = 2, scale = 1/lambda)) +
theme_bw() +
xlim(0, 2.5) +
ylab("S(t)") +
theme(axis.title.y = element_text(angle=0)) +
theme(legend.position="bottom") +
guides(
  col =
    guide_legend(
      title = "p",
      label.theme =
        element_text(
          size = 12)))
```

Figure 3: Survival functions for Weibull distribution

1.1.3 Exponential Regression

For each subject i, define a linear predictor:

$$\eta(\tilde{x}) = \beta_0 + (\beta_1 x_1 + \cdots + \beta_p x_p)$$
$$\lambda(t|\tilde{x}) = \exp\{\eta(\tilde{x})\}$$
$$\lambda_0 \stackrel{\text{def}}{=} \lambda(t|\tilde{0})$$
$$= \exp\{\eta(\tilde{0})\}$$
$$= \exp\{\beta_0 + (\beta_1 \cdot 0 + \cdots + \beta_p \cdot 0)\}$$
$$= \exp\{\beta_0 + 0\}$$
$$= \exp\{\beta_0\}$$

We let the linear predictor have a constant term, and when there are no additional predictors the hazard is $\lambda = \exp\{\beta_0\}$. This has a log link as in a generalized linear model. Since the hazard does not depend on t, the hazards are (trivially) proportional.

1.1.4 Accelerated Failure Time

Previously, we assumed the hazards were proportional; that is, the covariates multiplied the baseline hazard function:

$$h(T = t|X = x) \stackrel{\text{def}}{=} p(T = t|X = x, T \geq t)$$
$$= \lambda(t|X = 0) \cdot \exp\{\eta(x)\}$$
$$= \lambda(t|X = 0) \cdot \theta(x)$$
$$= \lambda_0(t) \cdot \theta(x)$$

and correspondingly,

$$\Lambda(t|x) = \theta(x)\Lambda_0(t)$$
$$S(t|x) = \exp\{-\Lambda(t|x)\}$$
$$= \exp\{-\theta(x) \cdot \Lambda_0(t)\}$$
$$= (\exp\{-\Lambda_0(t)\})^{\theta(x)}$$
$$= (S_0(t))^{\theta(x)}$$

An alternative modeling assumption would be

$$S(t|X = x) = S_0(t \cdot \theta(x))$$

where $\theta(x) = \exp\{\eta(x)\}$, $\eta(x) = \beta_1 x_1 + \cdots + \beta_p x_p$, and $S_0(t) = P(T \geq t|X = 0)$ is the base survival function.

Then

$$E[T|X = x] = \int_{t=0}^{\infty} S(t|x)dt$$
$$= \int_{t=0}^{\infty} S_0(t \cdot \theta(x))dt$$
$$= \int_{u=0}^{\infty} S_0(u)du \cdot \theta(x)^{-1}$$
$$= \theta(x)^{-1} \cdot \int_{u=0}^{\infty} S_0(u)du$$
$$= \theta(x)^{-1} \cdot E[T|X = 0]$$

So the mean of T given $X = x$ is the baseline mean divided by $\theta(x) = \exp\{\eta(x)\}$.

This modeling strategy is called an accelerated failure time model, because covariates cause uniform acceleration (or slowing) of failure times.

Additionally:

$$\Lambda(t|x) = \Lambda_0(\theta(x) \cdot t)$$
$$\lambda(t|x) = \theta(x) \cdot \lambda_0(\theta(x) \cdot t)$$

If the base distribution is exponential with parameter λ then

$$S(t|x) = \exp\{-\lambda \cdot t\theta(x)\}$$
$$= [\exp\{-\lambda t\}]^{\theta(x)}$$

which is an exponential model with base hazard multiplied by $\theta(x)$, which is also the proportional hazards model.

In terms of the log survival time $Y = \log T$ the model can be written as

$$Y = \alpha - \eta + W$$
$$\alpha = -\log \lambda$$

where W has the extreme value distribution. The estimated parameter λ is the intercept and the other coefficients are those of η, which will be the opposite sign of those for coxph.

For a Weibull distribution, the hazard function and the survival function are

$$\lambda(t) = \lambda p(\lambda t)^{p-1}$$
$$S(t) = e^{-(\lambda t)^p}$$

We can construct a proportional hazards model by using a linear predictor η_i without constant term and letting $\theta_i = e^{\eta_i}$ we have

$$\lambda(t) = \lambda p(\lambda t)^{p-1}\theta_i$$

A distribution with $\lambda(t) = \lambda p(\lambda t)^{p-1}\theta_i$ is a Weibull distribution with parameters $\lambda^* = \lambda\theta_i^{1/p}$ and p so the survival function is

$$S^*(t) = e^{-(\lambda^* t)^p}$$
$$= e^{-(\lambda\theta^{1/p}t)^p}$$
$$= S(t\theta^{1/p})$$

so this is also an accelerated failure time model.

In terms of the log survival time $Y = \log T$ the model can be written as

$$Y = \alpha - \sigma\eta + \sigma W$$
$$\alpha = -\log \lambda$$
$$\sigma = 1/p$$

where W has the extreme value distribution. The estimated parameter λ is the intercept and the other coefficients are those of η, which will be the opposite sign of those for `coxph`.

These AFT models are log-linear, meaning that the linear predictor has a log link. The exponential and the Weibull are the only log-linear models that are simultaneously proportional hazards models. Other parametric distributions can be used for survival regression either as a proportional hazards model or as an accelerated failure time model.

1.1.5 Dataset: Leukemia treatments

Remission survival times on 42 leukemia patients, half on new treatment, half on standard treatment.

This is the same data as the `drug6mp` data from KMsurv, but with two other variables and without the pairing.

```r
library(haven)
library(survival)
anderson =
  paste0(
    "http://web1.sph.emory.edu/dkleinb/allDatasets",
    "/surv2datasets/anderson.dta") |>
  read_dta() |>
  mutate(
    status = status |>
      case_match(
        1 ~ "relapse",
        0 ~ "censored"
      ),
    sex = sex |>
      case_match(
        0 ~ "female",
        1 ~ "male"
      ),

    rx = rx |>
      case_match(
        0 ~ "new",
        1 ~ "standard"
      ),

    surv = Surv(time = survt,event = (status == "relapse"))
  )

print(anderson)
```

Cox semi-parametric model

```r
anderson.cox0 = coxph(
  formula = surv ~ rx,
  data = anderson)

#>
#> Exponential distribution
#> Loglik(model)= -108.5   Loglik(intercept only)= -116.8
#>  Chisq= 16.49 on 1 degrees of freedom, p= 4.9e-05
#> Number of Newton-Raphson Iterations: 4
#> n= 42
```

Diagnostic - complementary log-log survival plot

```
library(survminer)
survfit(
  formula = surv ~ rx,
  data = anderson) |>
  ggsurvplot(fun = "cloglog")
```
If the cloglog plot is linear, then a Weibull model may be ok.

1.2 Combining left-truncation and interval-censoring

From [https://stat.ethz.ch/pipermail/r-help/2015-August/431733.html]:

> coxph does left truncation but not left (or interval) censoring survreg does interval censoring but not left truncation (or time dependent covariates).

- Terry Therneau, August 31, 2015
